PineForge Corpus Validation Report

PineForge Corpus Validation Report

Generated: 2026-10-13 (UTC) — engine `7da487ab`, corpus `08668b5`

All probes live under `corpus/validation/`; categories below are derived from each slug's leading hyphen-token (e.g. `ta-...`, `composite-...`).

Headline

- **Total probes verified:** 316
- **Excellent:** 311 (98.4%)
- **Strong:** 4
- **Moderate:** 0
- **Weak:** 0
- **Minimal:** 0
- **Anomaly (TV-side, expected):** 1
- **Engine-only by design:** 0
- **Missing:** 0

Anomalies & Non-Excellent

Each row points at a probe under `corpus/validation/`; rationale is captured in the probe's `inputs.json` notes field where present.

Tier	Probe	TV	Eng	Count Δ	PnL p90	Reason
anomaly	`anomaly-equity-mirror-strategy-equity-01`	21	25	16.0000%	3.1831%	TV broker margin-boundary non-determinism at the exact 1x equity boundary (>=95% confidence, deep-analyzed). Engine is deterministic and CORRECT per Pine semantics; TV admits some over-equity entries and rejects some under-equity ones non-monotonically. Cannot be made to match TV without replicating TV's broker bug. See pineforge-utils/parity-anomalies/tv-margin-boundary.md and corpus/validation_report.md headline. Sibling probes (parity-probe-04/05/06) that leave any meaningful headroom below 100% equity match perfectly; only this 1.0x-pinned probe surfaces the boundary divergence.
strong	`mtf-htf-60-close-change-baseline-01`	8776	8775	0.0114%	0.0000%	count Δ 0.01%
strong	`mtf-htf-60-close-roll-01`	8776	8775	0.0114%	0.0000%	count Δ 0.01%
strong	`ta-macd-histogram-reversal-01`	2815	2814	0.0355%	0.0000%	count Δ 0.04%

Tier	Probe	TV	Eng	Count Δ	PnL p90	Reason
strong	ta-stochastic-rsi-cross-01	1337	1337	0.0000%	0.0000%	Park at strong: coverage 97.6% (32 of 1337 TV trades unmatched) after the ta.sma exact-order window-sum fix. The residual is 100% TV-side and irreducible. Decomposition, measured against an independent Pine-faithful reference for the whole chain (ta.rsi via seeded RMA -> ta.stoch(rsi,rsi,rsi,14) -> k=ta.sma(stoch,3) -> d=ta.sma(k,3)) with exact-order window summation, comparing k and d BITWISE (raw IEEE-754 ULP delta) at the signal bar of every divergent entry: BEFORE the fix (engine 1292 matched, 96.6%) the engine contributed 38 TV-only entries at non-tie bars (running-sum drift SHIFTED real crosses) and 38 engine-only entries at exact-tie bars (drift MANUFACTURED crosses at algebraic ties); AFTER the fix (1305 matched, 97.6%) all 44 remaining TV-only entries sit on bars where k == d to the last bit (0 ULP), and all 44 paired engine-only entries sit on the next bar where the tie genuinely breaks. ta.crossover / ta.crossunder are STRICT inequalities, so no correct implementation at any precision may fire at an exact tie; the engine declines and TV fires. The construct saturates constantly - ta.stoch returns exactly 100.0 or 0.0 whenever rsi is its own 14-window extremum (x/x -> 1.0, *100 exact in IEEE-754) - and the three k-windows feeding d are then rotations of one multiset, so 9*(k-d) = 2*s_t* + *s_{t-1}* - 2s_{t-3} - s_{t-4} = 0 exactly. TV's own behaviour at those bars is inconsistent: inside the comparison window there are 508 bars with k == d bitwise, 506 of them inside the OB/OS gate (k<20 or k>80) where a cross would book a trade, and TV fires on exactly 44 of the 506 - 8.7%, roughly one tie in eleven. This is the finding-384 class (TV's SMA is not a function of its window; ties are broken TV-side rather than by the data). Reaching excellent is not available to any correct engine: COVERAGE_EXCELLENT is 0.99 and the small-N escape needs <=1 unmatched TV trade, so closing the gap would mean firing strict inequalities on equality - re-introducing exactly the running-sum drift the fix removes - and then also reproducing WHICH 8.7% of ties TV picks. Anomaly-candidate for the tv-anomaly register; the 506-tie / 44-fire measurement is the write-up material.

Per-Strategy Detail

Sorted by category, then slug. `count Δ` is `|tv-eng|/max(tv,eng)`; `entry/exit/pnl p90` are 90th-percentile relative deltas across matched trades (PnL excludes scratch trades with `|tv_pnl| < $0.01`).
